Can someone please update this for me? I just went through the XML standard and don't see anything particularly interesting about E4X. I read on the E4X site that it is available and it has a lot of features, but I'd like to know if it's not just a dead language. A: XML is not dead - there are several implementations that have been released (Open Source, Clients, Web Services). E4X is quite useful for interoperability and extension - for example it allows you to extend a JS object with data from XML or from other JS objects. However it's not really possible to extend a JS object without having some sort of document in the source. A: XML is still very much alive, it's just not as popular as it used to be. Its most recent moment in the spotlight was with Ajax and now with various Web 2.0 technologies. As for the E4X spec, it has been superseded by ECMAScript 5, and E4X itself has been superseded by the Harmony object model, so any reference to it should be taken with a grain of salt. 1. Field of the Invention The invention is generally related to the field of monitoring devices for monitoring the operation of electrical energy systems. More specifically, the invention is related to an apparatus and method for detecting improper operations of two or more electrical loads that are electrically coupled to a power source. 2. Description of the Related Art Electricity is a very useful commodity. In many households, electricity is provided through the use of a power meter. A power meter is a type of monitoring device that measures the amount of electricity used and the energy content of the electricity. Power meters are used to monitor electrical energy usage and to bill customers for the amount of energy that is consumed. Other types of electrical energy monitoring devices include: meters that are used for the monitoring and measuring of power; watt-hour meters that measure the actual energy usage of an electrical device; and remote power monitors that measure and monitor the ca3bfb1094
